DIH-VADERS

DIH-MINERS

PVT LTD.

PROJECT ICE RUNNER

FUEL AND RESOURCES
FROM THE OUTER SPACE TO YOUR INNER SPACE

MINING ASTROIDS

EXTRACTED AND CURATED
VIA THE HAND OF PROFFESSIONALS

SUNLIGHT BAKES THE H_2O OUT OF ASTEROID RUBBLE

ALL DELIVERIES TO L1, BUT WHY ~~WATER~~ H_2O NOT PLATINUM?

water is overall a more consistently viable option over platinum due to multiple reasons like transport cost and difficulty, demand, value at destination and time till first revenue

01
LAUNCH
Starship sent to space from earthh using a appropriate rocket

35.2 T STACK

02
REACH
200 kW electric thrusters used to maneuver in space around rocks

1.8 YEARS

03
OPERATE
Parks 1 km away and howers 15 m up for collection. Never lands

NO ANCHORS

04
EXTRACT
Steam jets used to put rubbles into a sealed bag

10T ORE / DAY

05
PROCESS
Two 10 m mirrors bake it at 600 °C, then water freezes as ice

150T H_2O / YR

06
DELIVER
Then the hauler brings 150 t per trip to Earth-Moon L1 depot

1ST H_2O: YR 3.8

SHARED SYSTEMS
these work at all stages (mostly)

TAKATT (POWER)
Mirrors give 104 kW of heat; 117 m^2 of panels give 22.5 kW

RAASTE ME BAAT CHEET (COMMS & NAV)
Deep Space Network radio, up to 17 min delay; cameras + LIDAR

ATMANIRBHAR (AUTONOMY & FAILURE)
Runs itself; every critical part has a twin: 87% fully productive years

---

DIH-MINERS

THE OPPORTUNITY

WATER IS WORTH THE SAME AS THE LAUNCHING COST

A kilogram of water on Earth is nearly free. The same kilogram in low Earth orbit is worth roughly what it would cost to launch it there. There is a great market opportunity in space to provide water to space agencies, satellite operators. Prices ceiling in space will be controlled by the launch cost. Targeting NEA and nearby C-type asteroids will fulfill our demand.

POSSIBLE DEMAND OF IRON/NICKEL AMONG IN-SPACE BUILDER

Iron/nickel feedstock for structures, 3D printing in the space itself to repair, build spacecraft and equipments. Moreover, the asteroids we mine to get iron/nickel can be sold for survey and data collection.

PLATINUM IS IT REALLY WORTH IT?

Targeting only Platinum in M-Type aesteroids isn't really worth it, because the cost of mining and selling back in earth wont generate much revenue. But the PGMs we found while mining in S-Type and C-Type as a side product can be stored and later can be sold in the market as whole when the prices are high.

COST: THREE LEVERS CUT OUR WATER FROM $1,944 TO $514 A KILOGRAM

BEGINNING

$2.04B

1 miner, 2 tugs, 2 launches, 10 years → 1,050 t water

=$1.944 / KG

Break (it) down:
Development 37%
Spacecraft build 24%
Operations 15%
Propellant 13%
Launch 9% · Insurance 3%

TOP 3 DRIVERS (LEECHAD)	OUR FIX (HUMARA NAMAK)	COST / KG AFTER EACH CHANGE (CHOTE BADLAV)
1 · WATER OUTPUT ±$1,520 / kg	PICK A TARGET WITH ≥10% WATER AND ADD A 3RD MIRROR: 200 T A YEAR	$1,513
2 · DEVELOPMENT ±$571 / kg	BUILD ON AN EXISTING ELECTRIC-TUG DESIGN; ONE AVIONICS SET FOR BOTH CRAFT: -40%	$1,299
3 · PROPELLANT ±$416 / kg	SWAP KRYPTON ($2,000/KG) FOR ARGON ($15/KG) IN THE TUG THRUSTERS	$1,124

FINAL STAGE

$514

per kg of water

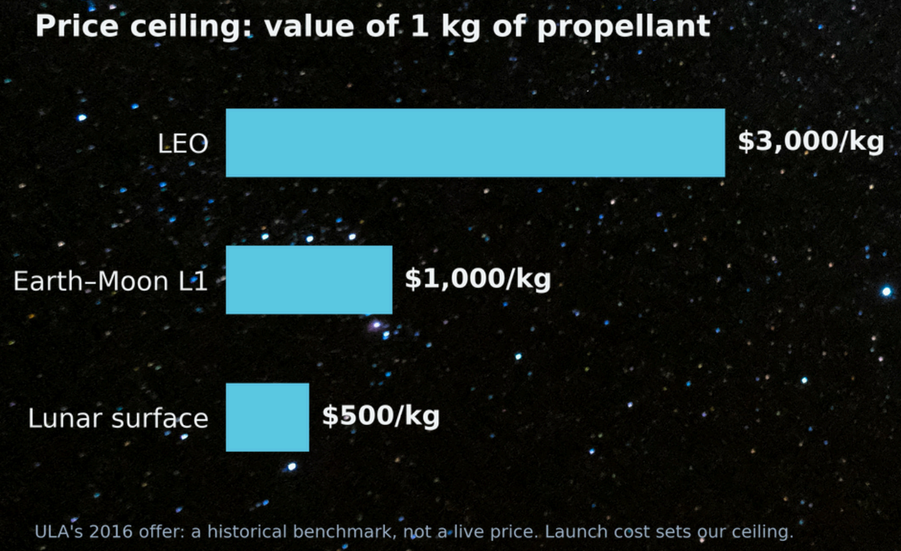

+3 miners, +6 tugs. Development already paid; each unit 10% cheaper per doubling

OUR COMPARISONS WITH OTHERS- KISKA HAI KITNA HAI KUM DAM

- **$514-1,124** — Ice Runner (with fixes)
- **$1,440** — Earth water by Starship (projected)
- **$3,648** — Earth water by Falcon Heavy (today)
- **$86,700** — One-off capture mission (Keck)

DIH-MINERS

OUR BUSINESS MODEL

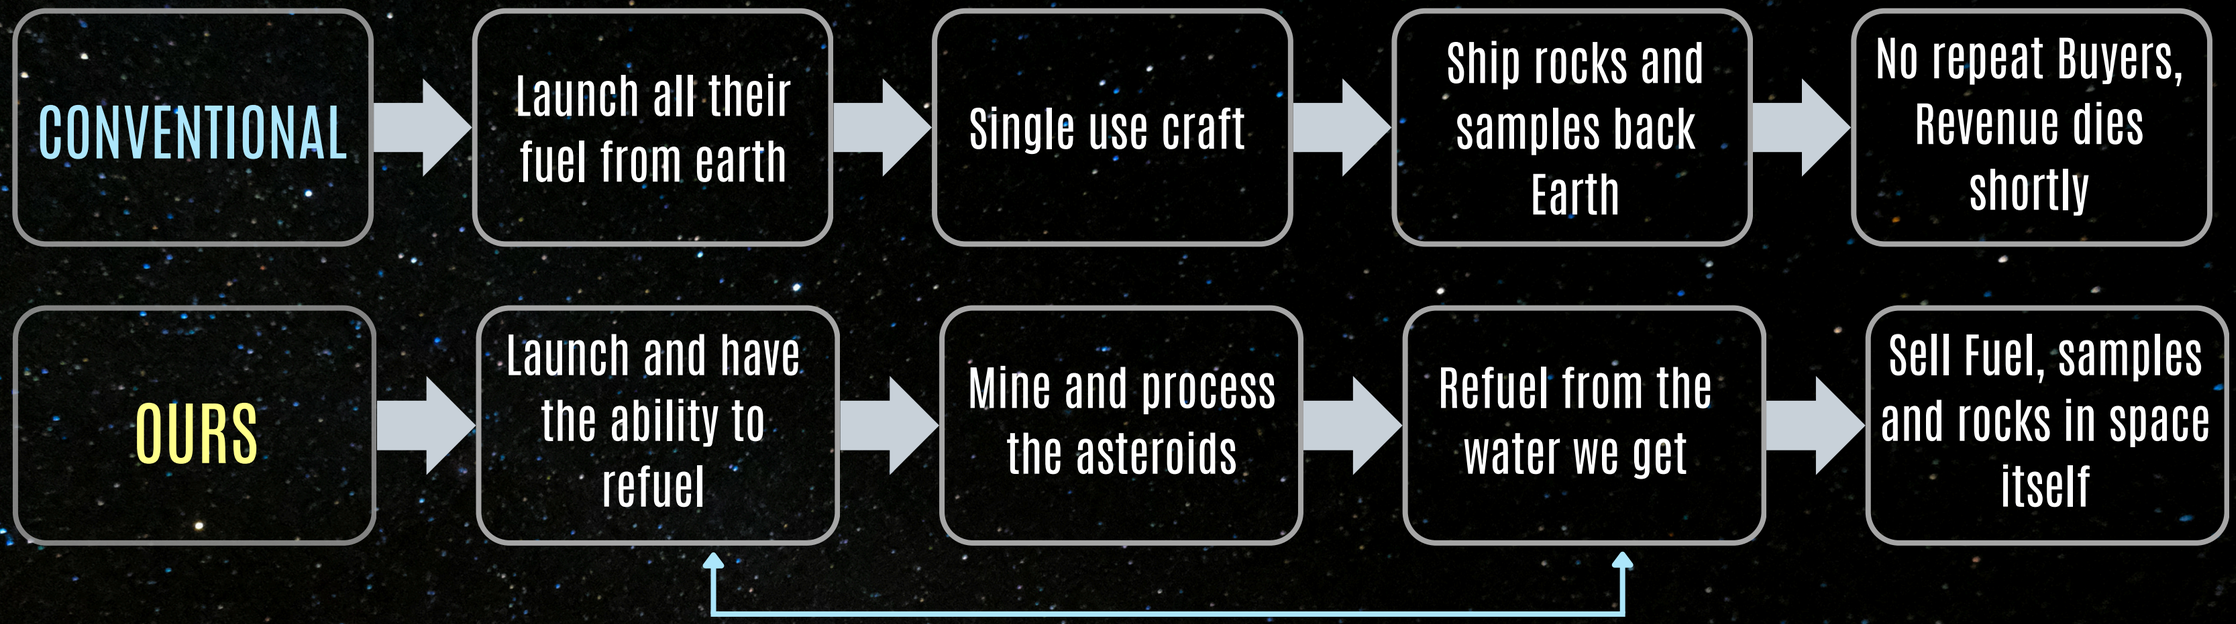

FIRST, A BRIEF ON WHAT OUR INVENTORY WILL BE

- Water which will come from c-type asteroids will serve as A Gas Station Where None Exists.crucial targets-LEO,GEO and earth-moon L1.
- Iron and Nickel will serve as building blocks of materials already in space.
- PGM we will hoard and sell at bulk to the industries in earth. selling them at a regular pace is pointless as adding supply will draw the prices downwards.

HOW WE MAKE MONEY?

- Contracts with space station and governments. risk-political and budget
- Sell asteroid data to scientists and research agencies. risk- very small market
- Long term contracts with companies for fuel and ores. risk-need credability from customer
- Service fee can be levied for refuelling but it would make us logistics comapny

DIH-MINERS

WHY US?

We process at the source to avoid waste mass

Revenue will be our utmost priority. Early contracts with government and other agencies will ensure cashflow

"We Don't Visit Asteroids. We Live Off Them."

WHAT COULD GO WRONG? WELL, 6 THINGS.

ENGINEERING ME PANGE

CANT SCALE TO 10T / DAY

Our bottleneck; at half rate, cost rises to ~$2,970/kg

LIKELIHOOD MEDIUM · IMPACT HIGH

Prove 1 t/day in a space demo before building the full miner; 3 swappable oven chambers

WARNING: DEMO RECOVERY UNDER 50%

ASTEROID IS DRIER

5% water instead of 8%: only 94 t a year

LIKELIHOOD MEDIUM · IMPACT HIGH

3-month survey confirms grade first; 3 backup targets ranked by ground spectra

WARNING: SURVEY GRADE UNDER 8%

WE LOSE CONTACT

AstroForge's Odin was lost to comms faults in 2025

LIKELIHOOD MEDIUM · IMPACT HIGH

Twin radios, Hauler as relay; miner keeps working alone, safe mode after 72 h

WARNING: NO UPLINK FOR 24 H

BUSINESS KE DANGE

NO BUYER AT L1

Why Planetary Resources and DSI died: no customers yet

LIKELIHOOD MEDIUM · IMPACT HIGH

Prove 1 t/day in a space demo before building the full miner; 3 swappable oven chambers

WARNING: NO ANCHOR CUSTOMER BY YEAR 2

STARSHIP UNDERCUTS US

At $200/kg to orbit, Earth water costs ~$480/kg at L1

LIKELIHOOD MEDIUM · IMPACT HIGH

Prove 1 t/day in a space demo before building the full miner; 3 swappable oven chambers

WARNING: LAUNCH PRICE UNDER $300/KG

CASH RUNS OUT

~$1.4B is spent before the first water, at year 3.8

LIKELIHOOD MEDIUM · IMPACT HIGH

Prove 1 t/day in a space demo before building the full miner; 3 swappable oven chambers

WARNING: A MILESTONE SLIPS 6 MONTHS
